### Τομή κύκλου-κύκλου

For the general position case with points  $(x_1, y_1)$   $(x_2, y_2)$  let

$$\begin{aligned}d &= \sqrt{(x_1 - x_2)^2 + (y_1 - y_2)^2} \\l &= \frac{r_1^2 - r_2^2 + d^2}{2d} \\h &= \sqrt{r_1^2 - l^2}\end{aligned}$$

Now  $\left(\frac{x_2 - x_1}{d}, \frac{y_2 - y_1}{d}\right)$   $\left(\frac{y_2 - y_1}{d}, -\frac{x_2 - x_1}{d}\right)$  are two orthogonal unit vectors and we can rotate and translate to get the general solution

$$\begin{aligned}x &= \frac{l}{d}(x_2 - x_1) \pm \frac{h}{d}(y_2 - y_1) + x_1, \\y &= \frac{l}{d}(y_2 - y_1) \mp \frac{h}{d}(x_2 - x_1) + y_1.\end{aligned}$$
